Please amend the claims as set forth below without prejudice to Applicant filing one or more continuation applications directed to the claims as originally filed.

In the Claims:

(currently amended) A medical apparatus comprising:

an overtube for receiving an endoscope therein, the overtube comprising a side opening for receiving tissue therethrough; and

a tissue sample device disposed in the overtube, the tissue sample device comprising a tissue cutter adapted to traverse a length of the side opening for severing a tissue sample from tissue extending into the side opening; and

a deformable tissue stop disposed inwardly of the side opening.

- 2. (currently amended) The medical apparatus of Claim 1 wherein the overtube is rotatable with respect to an endoscope received therein, wherein the tissue sample device comprises a tissue stop disposed inwardly of the side opening.
- 3. (currently amended) The medical apparatus of Claim 1 2 wherein at least a portion of the overtube associated with the side opening has a non circular cross-section wherein the tissue stop is deformable.
- 4. (currently amended) The medical apparatus of Claim 1 3 wherein the tissue stop is deformable from a first position to permit passage of an endoscope thereby, to a second position to receive and support a tissue mass drawn through the side opening.
- 5. (currently amended) The medical apparatus of Claim 12-wherein the tissue stop comprises at least one opening therethrough for communicating vacuum from a vacuum source to draw tissue into the side opening.
- 6. (original) The medical apparatus of Claim 5 wherein the tissue stop comprises a plurality of vacuum openings therethrough.
- 7. (original) The medical apparatus of Claim 1 wherein the tissue cutter is adapted to receive RF energy for cutting tissue.
- 8. (original) The medical apparatus of Claim 1 wherein the overtube comprises a distal end opening adapted to pass an endoscope.

- 9. (original) The medical apparatus of Claim 1 further comprising a tissue stop disposed inwardly of the opening, wherein the tissue stop provides a ground pole of an RF circuit.
- 10. (currently amended) A medical apparatus comprising:

a body with an outer surface having a side opening, the side opening for receiving tissue therethrough, a distal end opening, and a passageway for receiving an endoscope; and

a cutter for cutting tissue, the cutter adapted to traverse a length of the side opening for cutting tissue extending through the side opening; and

a deformable tissue stop disposed inwardly of the side opening.

11. (currently amended) A method for obtaining a tissue sample, the method comprising:

providing an endoscope;

providing an overtube having a side opening and a tissue cutter,

inserting the overtube into a patient's body with the endoscope;

receiving tissue into the side opening of the overtube; and

cutting tissue extending into the side opening with the tissue cutter;

wherein the overtube is rotatable with respect to the endoscope.

- 12. (original) The method of Claim 11 comprising the step of drawing tissue into the side opening with vacuum.
- 13. (original) The method of Claim 12 wherein the vacuum is communicated from a vacuum source through the endoscope.
- 14. (currently amended) The method of Claim 11 12-wherein at least a portion of the overtube associated with the side opening has a non circular cross section wherein the overtube is rotatable with respect to the endoscope.
